Executive Summary

This case study examines the member retention patterns and seasonal demand observed in a local village gym near Kolhapur. The study focuses on how the gym operates within a small community environment and the challenges it faces in maintaining consistent membership.

Observations reveal a clear seasonal trend in gym participation. A large number of individuals tend to join the gym between late May and early June, a pattern described in this study as the "June Motivation Effect." During the monsoon months, gym attendance increases significantly as many members actively participate in fitness activities. However, attendance gradually declines when major festival seasons such as Ganesh Chaturthi and Navratri approach, as people become busy with social and cultural commitments.

The study also identifies key operational challenges, including limited equipment capacity, irregular payment patterns due to community relationships, and competition from a better-equipped gym located farther away. Despite these challenges, the gym continues to attract members because of its affordability, convenient location, and friendly community atmosphere.

Based on the analysis, several recommendations are suggested, such as introducing longer membership plans, encouraging better machine rotation during peak periods, and implementing motivational activities to improve member retention.

Overall, the study highlights how small community-based gyms experience seasonal demand cycles and emphasizes the importance of simple management strategies to maintain stable membership levels.

1. Introduction

Fitness and physical well-being have become increasingly important in modern lifestyles. Gyms and fitness centres play a significant role in helping individuals maintain their health, improve strength, and develop disciplined exercise routines. While large commercial gyms in urban areas often have advanced equipment and professional trainers, smaller gyms in rural or semi-urban areas operate under different conditions.

These gyms usually function with limited equipment, smaller spaces, and fewer staff members. However, they often develop strong connections with the local community and provide affordable fitness opportunities to residents.

This case study focuses on a **local village gym near Kolhapur**, examining how it operates, the behaviour patterns of its members, and the challenges it faces. Particular attention is given to **seasonal membership trends**, especially the increase in members during the monsoon season and the decline during festival periods.

The purpose of this study is to understand **member retention patterns, operational challenges, and possible strategies that could improve the sustainability of small community-based gyms.**

---

2. Background of the Gym

The gym selected for this case study is a **community-based fitness centre located in a village area near Kolhapur**. Unlike large commercial fitness centres, this gym operates on a smaller scale and is managed entirely by the owner without additional staff. The gym primarily attracts students and young adults from the surrounding village area.

The facility consists of a **large hall that accommodates workout machines, free weights, and space for general exercises**. The gym currently operates with **approximately nine machines**, along with basic strength-training equipment.

The gym offers **flexible workout timings for male members throughout the day**, while a **separate batch for female members is conducted in the early morning from 5:00 AM to 7:00 AM**. This arrangement allows women in the community to train comfortably during a dedicated time period.

Since the gym is located within the village, many members personally know the owner. This creates a **friendly and community-oriented atmosphere**, which encourages people to join the gym even though the facilities are relatively simple compared to larger commercial gyms.

3. Member Behaviour and Seasonal Demand Patterns

One of the most noticeable patterns observed in this gym is the **seasonal fluctuation in membership demand**.

Most new members tend to join the gym **between late May and the first two weeks of June**. During this period, many individuals become motivated to begin their fitness journey, leading to a sudden increase in membership.

As a result, the gym experiences **higher attendance during the monsoon season**, and the facility becomes significantly more crowded compared to other times of the year.

However, the study also reveals a **decline in attendance after a few months**. Approximately **50% of members gradually stop attending when major festival seasons begin**, particularly during **Ganesh Chaturthi and Navratri**. During these periods, people often become busy with celebrations, social events, and family activities, which reduces their consistency in attending the gym.

This cycle creates a pattern where the gym experiences **high activity for a few months followed by a noticeable drop in attendance**.

Table 1: Seasonal Membership Pattern Observed in the Gym

Period	**Membership Trend**
Late May – Early June	Many new members join
Monsoon Months	Gym becomes crowded
Festival Season	Many members stop attending
After Festivals	Lower attendance

Based on observation, member behaviour in the gym appears to follow a repeating motivation cycle that begins with high enthusiasm and gradually declines over time.

Table 2: Member Motivation Cycle

Stage	Description
Initial Motivation (Late May – June)	Many individuals join the gym with strong enthusiasm and fitness goals.
Active Participation (Monsoon Months)	Members regularly attend workouts and the gym becomes crowded.
Distraction Period (Festival Season)	Festivals, social gatherings, and family activities reduce attendance.
Dropout Stage	Some members stop attending the gym completely.
Cycle Restart	The pattern repeats when new members join again the next year.

The "June Motivation Effect"

During the observation of gym activities, a noticeable behavioural pattern emerged among new members. A large number of individuals tend to join the gym **between late May and the first two weeks of June**. This sudden increase in memberships can be described as the **"June Motivation Effect."**

This effect refers to a temporary surge in fitness motivation that occurs at the beginning of the monsoon period. Several factors may contribute to this behaviour. Many students complete their academic exams around this time and have more free time available, which encourages them to begin fitness routines. In addition, the start of a new season often motivates individuals to set personal health goals and improve their physical fitness.

However, this motivation often proves to be **short-term rather than long-term**. After a few months, many members gradually reduce their attendance. A significant number eventually stop coming to the gym, particularly during major festival periods such as **Ganesh Chaturthi and Navratri**, when people become busy with social and cultural activities.

This pattern indicates that while initial enthusiasm encourages people to join the gym, maintaining consistent workout habits remains a challenge for many members.

Possible Reasons for Member Dropout

During the observation of gym attendance patterns, it was noticed that a significant number of members gradually stop attending after a few months. Several factors may contribute to this dropout pattern.

One possible reason is **temporary motivation**. Many individuals join the gym with high enthusiasm, especially during the monsoon season. However, maintaining a consistent workout routine requires discipline and long-term commitment, which some members find difficult to sustain.

Another important factor is the **festival season**. As major celebrations such as Ganesh Chaturthi and Navratri approach, people become busy with cultural activities, social gatherings, and family responsibilities. As a result, regular gym attendance often becomes less of a priority.

Lifestyle adjustments can also play a role. Students may experience changes in academic schedules, while working individuals may face work-related responsibilities that limit the time available for exercise.

Finally, the **initial excitement of joining a gym may gradually fade** for some members. Without continuous motivation or structured workout guidance, individuals may lose interest and discontinue their workouts.

Understanding these reasons is important for developing strategies that can help improve **member retention and long-term engagement in fitness activities**.

Seasonal Consumer Behaviour in Fitness Activities

The membership pattern observed in this gym reflects a form of **seasonal consumer behaviour**, where individuals are more likely to start certain activities during specific times of the year. In this case, the beginning of the monsoon season appears to trigger increased motivation for fitness among many individuals.

However, this motivation is often temporary and influenced by external factors such as festivals, social commitments, and lifestyle changes. As a result, the gym experiences a cycle of **high seasonal demand followed by a decline in attendance**, which is common in many small community-based fitness centres.

4. Pricing and Competitive Comparison

Pricing is an important factor influencing gym membership decisions in rural and semi-urban areas.

The gym examined in this case study charges a **monthly membership fee of ₹500**, making it an affordable option for students and local residents.

A competing gym located farther from the village charges approximately **₹700 per month**. While the competitor gym offers more advanced equipment and possibly better facilities, the higher price and longer travel distance influence the decisions of many potential members.

For many individuals, the **₹200 price difference** is significant. As a result, the local gym continues to attract members who prefer a **budget-friendly and conveniently located fitness centre**.

Additionally, the strong community connection between the owner and local residents encourages people to choose this gym despite its smaller scale.

Table 3: Comparison Between Local Gym and Competitor

Feature	**Local Village Gym**	**Competitor Gym**
Monthly Fee	₹500	₹700
Number of Machines	9	More machines
Distance	Inside the village	Farther away
Atmosphere	Community-based	Commercial
Management	Owner-managed	Multiple staff

---

5. Operational Challenges Faced by the Gym

Despite its popularity within the community, the gym faces several operational challenges.

One major challenge is **limited equipment capacity**. Although the gym has around nine machines, the facility becomes crowded during peak months when many new members join. During these periods, members sometimes **have to wait for machines**, which can slow down workout routines.

Another challenge is that the gym is **managed entirely by the owner**, who is responsible for multiple tasks such as managing memberships, collecting fees, maintaining equipment, and supervising the facility.

The gym also experiences **irregular payment patterns** because many members personally know the owner. Due to these friendly relationships, some members delay their membership payments, which can affect the gym's cash flow.

Additionally, the gym faces a **member retention problem**, as many individuals discontinue their workouts after a few months, particularly during festival seasons.

---

6. SWOT Analysis of the Gym

A SWOT analysis helps evaluate the internal and external factors that influence the performance of a business. It examines the **Strengths, Weaknesses, Opportunities, and Threats** associated with the gym.

Strengths

One of the major strengths of the gym is its **affordable pricing**, with a monthly membership fee of ₹500, which makes it accessible to students and local residents. The gym also benefits from its **convenient location within the village**, making it easy for members to visit regularly without needing to travel far.

Another strength is the **strong community connection** between the owner and the members. Since many members personally know the owner, the gym maintains a friendly and supportive environment that encourages people to join.

Weaknesses

The gym operates with **limited equipment**, currently having around nine machines. During peak periods such as the monsoon season, this can lead to crowding and waiting time for members.

Another weakness is that the gym is **managed entirely by the owner**, which means all responsibilities such as supervision, membership management, and maintenance depend on a single individual. This can limit the gym's ability to expand its services.

Opportunities

The gym has several opportunities for growth. Introducing **longer membership plans** such as quarterly or half-yearly packages could help improve member retention.

The gym could also benefit from **motivational programs or small fitness challenges**, especially during festival seasons when attendance usually drops. Such initiatives may help maintain member engagement.

Additionally, increasing awareness about fitness within the village could attract **new members from nearby areas**.

Threats

One of the main threats to the gym is the presence of a **better-equipped competitor gym** that offers more advanced facilities, although at a higher price.

Another threat is the **seasonal dropout of members**, especially during festival periods. This can create fluctuations in attendance and affect the gym's regular income.

Table 4: SWOT Summary of the Gym

Strengths	**Weaknesses**
Affordable membership fee (₹500)	Limited number of machines
Convenient village location	Crowding during peak months
Strong community relationships	Owner manages the gym alone

Opportunities	**Threats**
Introduce longer membership plans	Better-equipped competitor gym
Fitness challenges to retain members	Seasonal dropout during festivals
Attract members from nearby areas	Irregular payment patterns

7. Analysis and Recommendations

Based on the observations made during this study, several improvements could help the gym operate more efficiently.

One possible strategy is introducing **longer membership plans**, such as three-month or six-month packages at slightly discounted rates. This could encourage members to remain committed to their fitness routines for longer periods.

The gym could also manage peak-season crowding by encouraging **machine sharing and proper workout rotation**, which would help reduce waiting time during busy hours.

Another useful strategy would be to introduce **small fitness challenges or motivational activities during festival seasons**, encouraging members to maintain consistency even during busy periods.

Finally, the gym should continue leveraging its **community advantage**, focusing on affordability and friendly relationships with members, which are key strengths compared to larger commercial gyms.

---

8. Method of Observation

This case study is based on **direct observation** of gym operations and member behaviour over a period of time. Informal discussions with members and the gym owner also helped in understanding membership trends, operational challenges, and seasonal demand patterns.

---

9. Conclusion

This case study highlights how a small community-based gym operates within a rural environment and the unique challenges it faces. The study shows that **seasonal motivation plays a significant role in membership patterns**, with many individuals joining during the monsoon season and discontinuing their workouts during festival periods.

Despite limited equipment and resources, the gym continues to attract members due to its **affordability, convenience, and strong community connections**.

With simple improvements such as longer membership plans, better crowd management, and motivational strategies during festival seasons, the gym has the potential to **improve member retention and maintain more consistent attendance throughout the year**.
